

FRAGMENT MASS DISTRIBUTION FOR ^{238}U FISSION BY NEUTRONS IN THE ENERGY REGION FROM 2 TO 200 MeV.

Kibkalo Yu.V.

Institute for Nuclear Research, Kiev, Ukraine

The detailed analysis of experimental data for actinide nuclei fission at medium excitation energies shows that at formation of angular, mass and energy distributions of fission fragments the essential role is played by the spectrum of transition states above the fission barrier. The basic characteristics of transition states are the collective energy and the total angular momentum of the fissioning nucleus. Thus, the process of formation and scission of fragments is influenced not only by the temperature but also by the total angular momentum of the fissioning nucleus [1,2].

The double-peak structure of a fission barrier and the dependence of the transition states shapes of fissioning nuclei on excitation energy complicates the analysis and makes difficult the calculations of fragments yield for particular excitation energy of a fissioning nucleus. It is shown [3] that in the excitation energy range of 40 - 45 MeV the shell effects disappear and the nucleus "feels" medium properties only described by liquid-drop model. It means that the effective transition states of fissioning nuclei are gradually shifted from the shape of the second barrier to the liquid-drop saddle shape with increasing of excitation energy. Thus, the shape of mass and charge fission fragment distributions should change from the asymmetric shape corresponding to the double-peak fission barrier to the symmetric shape corresponding to the liquid-drop barrier.

To describe Zöller's data [4] for pre-neutron-emission fragment mass distributions of ^{238}U fission by neutrons in the energy interval from 2 to 200 MeV the five-gaussian model was used.

$$Y(A) = \sum_{i=1}^{i=5} \frac{Y_i}{\sigma_i \sqrt{2\pi}} \exp\left(-\frac{(A - A_i)^2}{2\sigma_i^2}\right), \quad (1)$$

where parameters subscripts 1 and 2 refer to light-peak components, 4 and 5 to heavy-peak components, and 3 to the central peak.

$A_f = A_0 - \bar{\nu}_{pre}$ is the mass of fissioning nucleus after emission of prefission neutrons.

$$\bar{\nu}_{pre} = 6.77 \left(\frac{(0.02 \cdot E^*)^2}{1 + (0.02 \cdot E^*)^2} + \exp\left[-\frac{(22.9 - E^*)^2}{2.625^2}\right] \right), \quad (2)$$

where E^* is the excitation energy of compound nucleus, A_0 .

$$A_3 = A_f / 2; \quad (3)$$

$$A_{1,5} = A_3 \mp 20.56; \quad (4)$$

$$A_{2,4} = A_3 \mp \begin{cases} 17.18 & \ell \leq \ell_{cr}, \\ 0 & \ell > \ell_{cr}, \end{cases} \quad (5)$$

where $\ell_{cr}=7\hbar$ is the critical value of angular momentum, above which the asymmetric components 2 and 4 is converted into symmetric component 3 in all excitation energy range.

$$\sigma_{1,5} = 5.29 + (1 - P_{LD}) \cdot 5.14; \quad (6)$$

$$\sigma_{2,4} = 2.81 + (1 - P_{LD}) \cdot 7.25; \quad (7)$$

$$\sigma_3 = 5.28 + (1 - P_{LD}) \cdot 13.07; \quad (8)$$

$$Y_{1,5} = 100 \cdot P_{LD}; \quad (9)$$

$$Y_{2,4} = 100(1 - P_{LD}) \cdot s_1; \quad (10)$$

$$Y_3 = 200(1 - P_{LD}) \cdot s_2; \quad (11)$$

Here P_{LD} is the function, which describes converting of asymmetric mass fragment distribution into symmetric form with increasing of excitation energy of a fissioning nucleus. s_1 and s_2 are functions, which take into account a dependence of fragment mass distributions on angular momentum of fissioning nucleus.

$$P_{LD} = \left[1 + \exp\left(\frac{E^* - 44.7}{91.2}\right) \right]^{-1}; \quad (12)$$

$$s_1 = \sum_{\ell=0}^{\ell=\ell_{cr}} (2\ell+1) T_\ell / \sum_{\ell=0}^{\ell=\infty} (2\ell+1) T_\ell; \quad (13)$$

$$s_2 = 1 - s_1; \quad (14)$$

Here T_ℓ are transmission coefficients in the input channel of reaction [5].

The results of description of Zöller's data [4] for pre-neutron-emission fragment mass distributions of ^{238}U fission by neutrons in the energy region from 2 to 200 MeV are summarized in Figs. 1 – 3 and Tables 1 – 3.

The results of calculations of pre-neutron-emission fragment mass distributions for ^{238}U fission by neutrons for other energies ($E_n = 1.6$ MeV, 8 MeV, 14.5 MeV, 21 MeV, 28 MeV and 100 MeV) are shown in Fig.4 and Table 4.

The authors are indebted to Dr. M.Lammer for supporting the work and partial translations of Zöller's thesis and to Dr. V.M.Maslov for providing numerical data of transmission coefficients.
