TM on Nuclear Data Processing

Status of the ACE Verification Project

Andrej Trkov, IAEA

Stage 1

Objectives:

Verify that codes can assemble correctly the cross sections into an ACE file (no probability tables)

Statistics:

10 variants of ACE file assembly:

- 2 variants of processing with NJOY

- 2 codes using NJOY for the final ACE file assembly

- 5 codes independent of NJOY

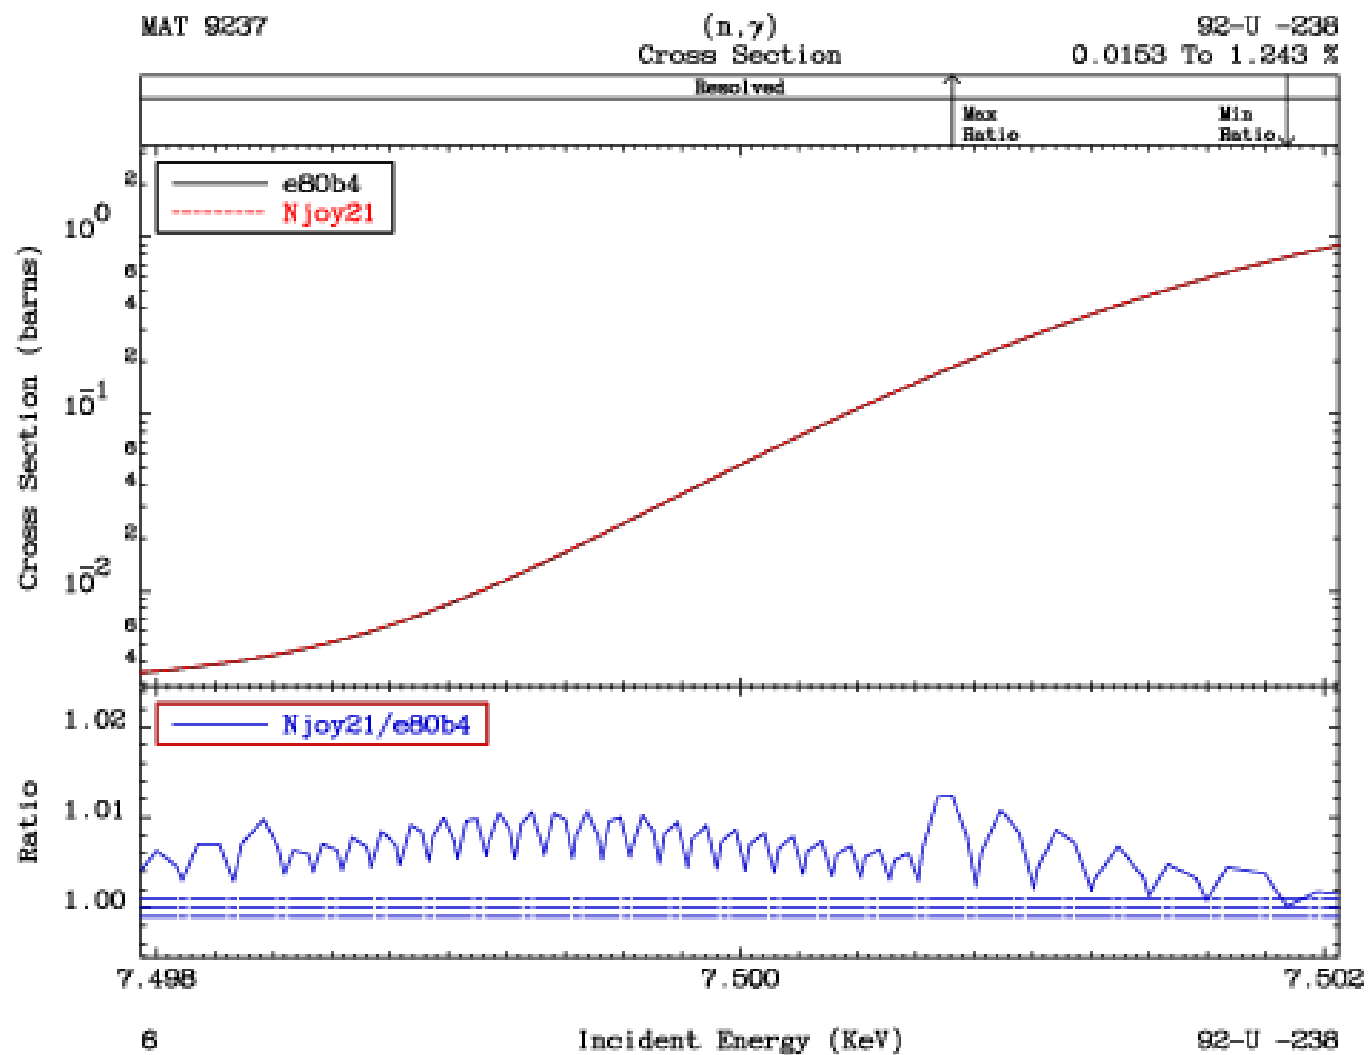

- 1 additional code announced

List of participating codes

- **NJOY16/NJOY21** – conventional code for ACE file preparation (full capability, USA)
- **LEGEND/NJOY** – Angular distributions in the original ENDF file converted to tabular form with LEGEND of PREPRO (full capability, USA)
- **PREPRO/ACEMAKER** – wrap-around PREPRO to assemble the ACE file (fast neutrons only, Cuba)
- **FRENDY** (full capability, Japan)
- **FUDGE** (fast neutrons only, no self-shielding, USA)
- **GAIA/NJOY** (resonance reconstruction and Doppler broadening only, France)
- **GALILEE/NJOY** (resonance reconstruction and Doppler broadening only, France)
- **GRUCON** (full capability, Russia)
- **NECP-Atlas** (results to be submitted, China)
- **RULER** (no self-shielding, China)

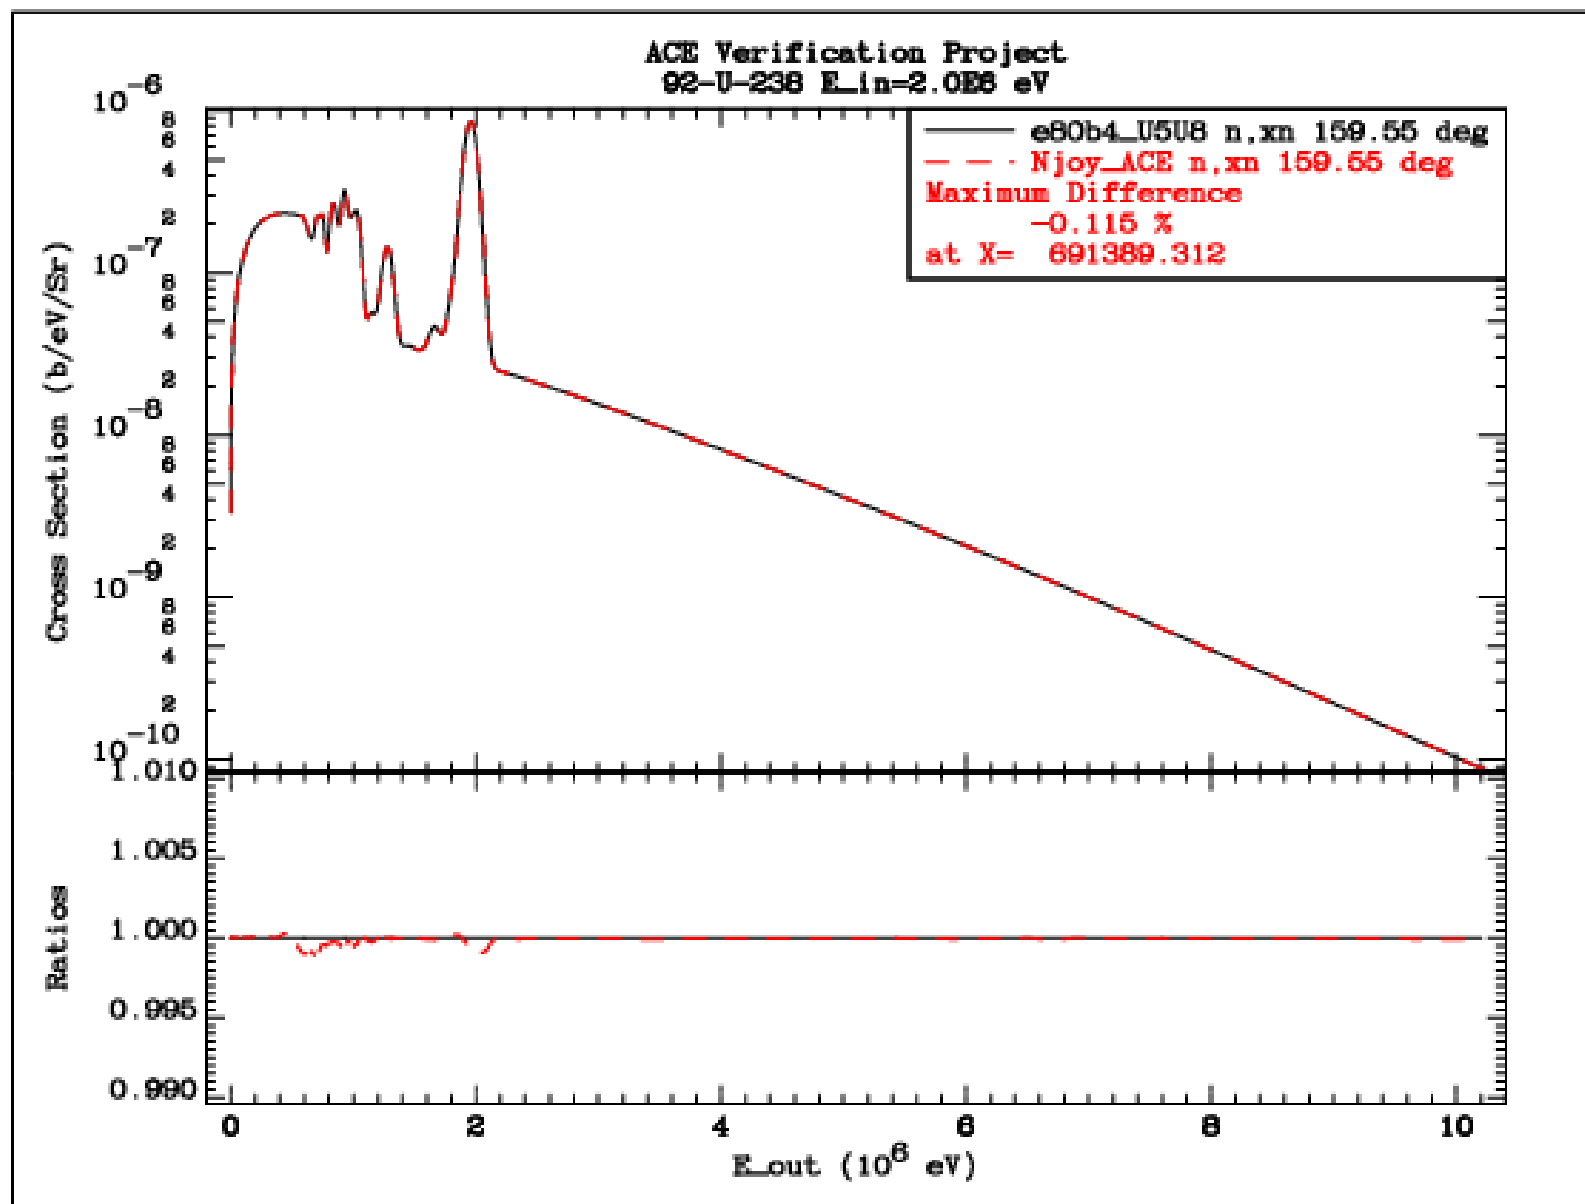

Procedures

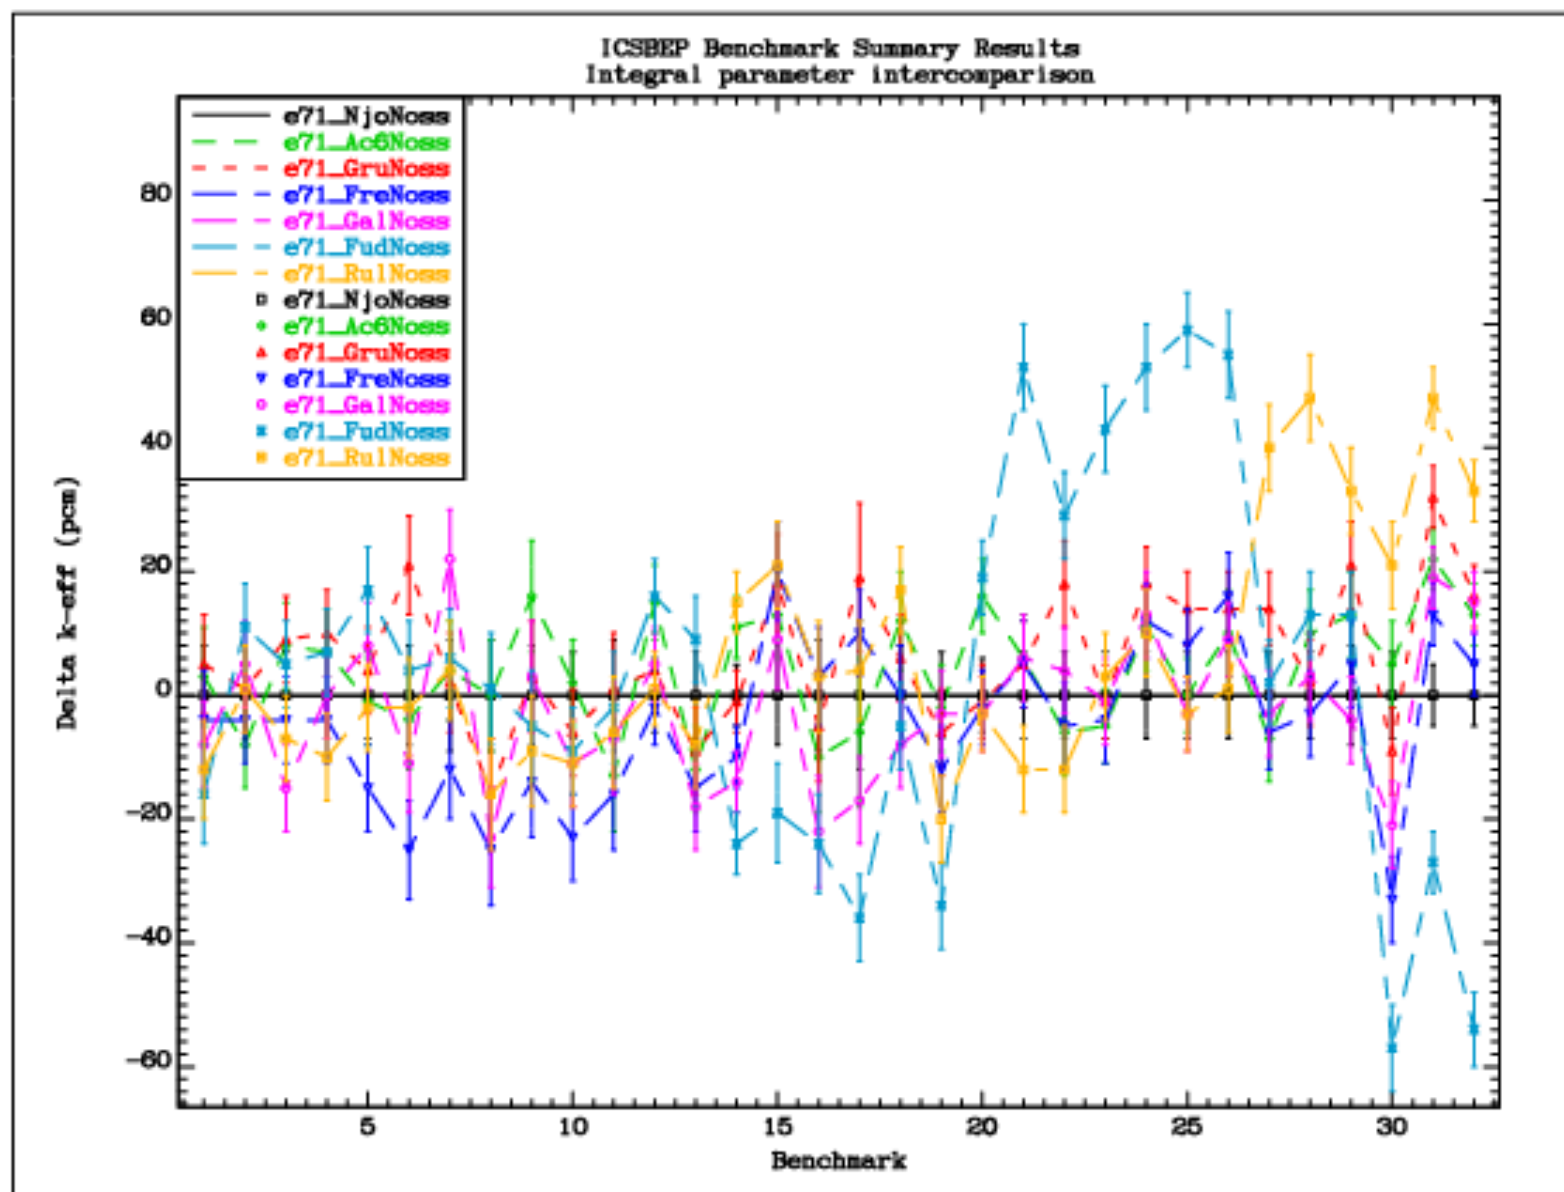

- Test cases: U-235 and U-238 from ENDF/B-VIII.b4
- Cross section comparison to PREPRO, including angular distributions and double-differential data using modules of PREPRO, ENDVER and auxiliary codes
- Examples:

Conclusions

- Stage-1 successfully completed (some results still pending)
- Stage-2 will involve calculations with self-shielding
- Additional stages to be determined:
 - Photon production
 - Thermal scattering
 - Heating/damage ...
