

Comparison of Neutron Activation Analysis k_0 and σ_0 Data

Richard B. Firestone
Lawrence Berkeley National Laboratory, Berkeley CA 94720 USA

Third Co-ordination Meeting on
Reference Database for Neutron Activation Analysis
November 17-19, 2008
IAEA, Vienna Austria

Summary: Neutron Activation Analysis (NAA) k_0 factors from De Corte and Simonits [1] for $Z \leq 47$ have been compared with k_0 values calculated from the evaluated total thermal neutron capture radiative cross sections σ_0 in the Atlas of Neutron Resonances [2] and partial γ -ray cross sections σ_γ measured with neutron beams at the Budapest Reactor [3,4]. The k_0 factors derived from these independent data sources generally agree although several discrepancies need to be resolved. New self-consistent k_0 and σ_0 values have been adopted by evaluation of these data and other published information. It is proposed to publish a *Reference Database for Neutron Activation Analysis* containing a summary of all measurements and tables of recommended k_0 and σ_0 data. These data will also be updated in the first revision of the Evaluated Gamma-ray Activation File (EGAF) [5] for dissemination by the IAEA and Lawrence Berkeley National Laboratory (LBNL).

Introduction: The Neutron Activation Analysis (NAA) k_0 factors ($k_{0,Au,x}$) for γ -rays emitted by activation products (x) are defined relative to the Au comparator as,

$$(1) \quad (k_{0,Au})_x = [M_{Au}\theta_x\sigma_{0,x}P_x] / [M_x\theta_{Au}\sigma_{0,Au}P_{Au}]$$

where M is the atomic mass ($M_{Au}=196.96655$), θ is the isotopic abundance ($\theta_{Au}=100$), σ_0 is the total thermal radiative cross section ($\sigma_{0,Au}=98.65$ b), and P is the γ -ray transition probability ($P_{Au}=0.9554$). Precise k_0 factors have been measured by De Corte and Simonits [1] for the principal γ -rays from more than 130 isotopes and isomers using gold as a comparator. These values are compared in Table 1 with k_0 values derived from σ_0 values compiled in the Atlas of Neutron Resonances [2] and σ_γ values measured with guided neutron beams at the Budapest Reactor [3,4]. As shown in Eq. 1 k_0 values derived from σ_0 also require γ -ray transition probabilities, P_γ , which are taken either from the Decay Data Evaluation Project (DDEP) evaluations [6] or the ENSDF database [7]. Table 1 also compares the recommended σ_0 values [2] with adopted σ_0 values from this work based on all measurements referenced in the CSISRS file [8] and the σ_γ and k_0 values. An example of the cross section comparison for $^{26}\text{Mg}(n,\gamma)^{27}\text{Mg}$ is shown in Table 2. New recommended k_0 values based on the adopted σ_0 values are presented in Table 1. The agreement between the De

Corte and Simonits [1] k_0 values and those derived from the cross section data are generally very good although some important discrepancies remain.

Table 2. $^{26}\text{Mg}(n,\gamma)^{27}\text{Mg}$ σ_0 measurements.

Adopted Value	0.0379	0.0008

Discrepant values: A total of 213 k_0 and σ_0 factors for Z=5-47 are compared in Table 1. Data for additional isotopes not included in Ref. 1 have been added. Agreement is generally excellent and the following discrepancies are noted.

^{23}Na – $\sigma_0(\text{Atlas})=517(4)$ mb is consistent with $\sigma_0(\text{ADNDT})=513(6)$ mb but inconsistent with the Budapest values $\sigma_0(\text{PGAA})=540(4)$ mb and $\sigma_0(\text{NAA})=542(3)$ mb. The higher values are consistent with several measurements in the literature. New experiments are planned in collaboration with A. Simonits and Zs. Revay to remeasure this cross section.

^{36}S – significant variations in the abundance of ^{36}S make these k_0 values very unreliable. Value from Atlas is adopted assuming normal natural abundance.

^{41}K - $\sigma_0(\text{Atlas})=1.46(3)$ b is consistent with $\sigma_0(\text{ADNDT})=1.42(2)$ mb but inconsistent with the Budapest value $\sigma_0(\text{NAA})=1.73(1)$ b. New experiments are planned in collaboration with A. Simonits and Zs. Revay to remeasure this cross section.

^{46}Ca – $k_0(\text{ADNDT})=8.57\text{E-}07$ is lower than $k_0(\text{Adopt})=9.97\text{E-}07$ to ^{47}Sc . Needs to be remeasured. Possible P_γ problem.

^{64}Ni - $\sigma_0(\text{Atlas})=1.64(4)$ b is consistent with $\sigma_0(\text{ADNDT})=1.61(1)$ b but inconsistent with the Budapest value $\sigma_0(\text{PGAA})=2.36(26)$ b. PGAA measurement will be rechecked.

^{64}Zn – $k_0(\text{ADNDT})=5.72\text{E-}03$ is lower than $k_0(\text{Adopt})=6.55\text{E-}03$.

^{74}Ge – $k_0(\text{ADNDT})=5.73\text{E-}04$ for 139.7 keV gamma is inconsistent with $k_0(\text{Adopt})=6.71\text{E-}04$ and $k_0(\text{Budapest})=6.68\text{E-}04$. New value adopted.

^{89}Y – new cross section inconsistent with $k_0(\text{ADNDT})$. Check cross section.

^{98}Mo – For 140.5-keV gamma from ^{99m}Tc $k_0(\text{ADNDT})=5.27\text{E-}04$ is lower than $k_0(\text{Adopt})=6.05\text{E-}04$ but comparable to $k_0(\text{Budapest})=5.56\text{E-}04$. Check cross sections and decay scheme.

Proposed Reference Database for Neutron Activation Analysis: Evaluation of thermal neutron capture data for Neutron Activation Analysis will be completed over the next year. The resulting database will include recommended self-consistent data for k_0 values and associated target σ_0 cross sections and contain

1. k_0 measurements by De Corte and Simonits [1], Budapest NAA measurements with the neutron beam, and from other literature sources.
2. σ_0 values from the Atlas of Neutron Resonances [2], CSISRS file [8], Budapest PGAA measurements and other literature sources.
3. P_γ values from the BIPM evaluation [6] and the ENSDF file [7].
4. Self consistent recommended k_0 and σ_0 values for selected gamma rays and targets.
5. Complete gamma-ray k_0 library for all known gamma rays produced by NAA.

It is proposed to publish this database in the open literature and as the first revision of the EGAF database which is disseminated by the IAEA and Lawrence Berkeley National Laboratory, Berkeley CA.
