

EXFOR completeness checking for n-, p- and alpha-induced data against NSR through extended CINDA

V.Zerkin: Automatic import information from NSR to CINDA [1]

V. Semkova: Completeness checking

L. Vrapchenjak: PDF files for the missing publications.

N. Otsuka: Final checking?

The CINDA relational database developed at IAEA-NDS by V. Zerkin programmatically extract information from other databases as described in WP2010-22. The retrieval system provides functionality that reads NSR records and checks if the articles that contain quantities relevant for EXFOR are compiled.

Request for data from NSR [2] missing in EXFOR was based on following criterion:

Format manuals» CINDA | EXFOR | ENDF-6 Databases» EXFOR | ENDF | IBANDL | NSR CD-ROM» EXFOR-CINDA | CD-Catalog

Computer Index of Nuclear Reaction Data (CINDA)

Database Version of 2017-05-10
Software Version of 2017-04-11

CINDA contains bibliographic references to measurements, calculations, reviews, and evaluations of neutron cross-sections and other microscopic neutron libraries of numerical neutron data available from four regional neutron data centers.
Since 2005, CINDA database is extended by photonuclear and charged particle reaction data.
The database is automatically extended by information from EXFOR and NSR (~every Month).

Comments/Remarks?

Note:
- all criteria are optional (selected by checking ☒)

2. The total number of retrieved references was 142 for the neutron-induced data, 371 for proton-induced cross section data, and for 1179 for alpha particle induced data were 1179. However, not all references really contain data that can be compiled in EXFOR. So, each publication was assessed and the type of data and facility defined in order to assign to the corresponding data Centre

for compilation. We have made list of 13 publications for neutron induced data, 129 for proton induced data and 443 for alpha induced data to be compiled.
