

EXFOR completeness for cross section data for space radiation protection

(N. Otsuka, 2023-11-09, CP-D/1095)

A recent publication by M.S. Smith et al. [1] discusses databases, dissemination, and compilation of nuclear reaction data in the relation with radiation protection of astronauts and electronic devices exposed by galactic cosmic rays (GCR). The following figure (reproduced from T.C.Slaba et al. [2]) shows fraction of doses caused by various ions up to $Z\sim 26$ accelerated up to ~ 10 GeV/u.

Collection of experimental cross sections helps validation of transport codes (e.g., Geant4, PHITS) applied to space radiation protection as well as heavy-ion therapy. Smith et al. introduce the following two compilations of cross sections for space research:

1. GSI-ESA-NASA database [3] (1,786 cross section data from 103 publications): This is an excellent compilation of angular and energy integrated cross sections such as total reaction cross sections (SF3=NON) and total charge changing cross sections (SF3=TCC). Not only the reaction and cross section but also data description (e.g., doi, sample thickness, facility, uncertainty type) are nicely tabulated in a simple form. The website (<https://bioapp.gsi.de/cross-section-db/>) provides retrieval function, but one can also download the whole database in EXCEL, CSV etc.
2. NUCDAT database [4] (~50,000 entries): This covers partial cross sections and differential cross sections including those expressed by relativistic kinematic variables such as rapidity and transverse mass. An index (e.g., projectile, incident energy, target, fragment nuclide, quantity) of this database is shown in the full description of the database [5]. I cannot find this database on the internet, and it is not clear for me if this database provides numerical data or index only.

Many datasets compiled in these databases are for projectile heavier than $A=13$ or projectile energy higher than 1 GeV (category B defined in the NRDC Protocol), and we do not guarantee their completeness in EXFOR. However, all CPND centres (other than NEA DB) compile the newly published heavy-ion induced reaction data, and it would be of our interest to see to what extent EXFOR is complete for space application. In the analysis discussed in this memo,

- An article reporting both categories A and B data was treated as a category A article.

- The upper boundary energy for the category A was set to 1 GeV/u rather than to 1 GeV).
- The quantity involving a independent or dependent variable undefined in the dictionary (e.g., transverse mass, invariant cross section) is not for EXFOR compilation. (i.e., not EXFORable).

The following summary tables show the EXFOR coverage is 47% for the GSI-ESA-NASA database and 68% for the NUCDAT database.

Table 1. EXFOR coverage of articles compiled in the GSI-ESA-NASA database (“EUR A/B” means experiments performed in area 2 countries other than Japan under category A/B)

	Total	USA	JPN	EUR (A)	EUR (B)	Rest
GSI-ESA-NASA DB	103	38	22	20	14	9
in X4	48	14	16	7	6	5
missing in X4	55	24	6	13	8	4
X4 coverage	47%	37%	73%	35%	43%	56%

Table 2. EXFOR coverage of articles compiled in NUCDAT database (See the table 1 caption for EUR A/B. “Total” means “EXFORable total”.

	Total	USA	JPN	EUR (A)	EUR (B)	Rest
NUCDAT	398	178	53	123		44
in X4	270	102	47	84		38
missing in X4	128	76	6	17	22	6
X4 coverage	68%	57%	89%	66%		84%

These tables are based on the full summary of my analysis summarized in the tables appended to this memo. (In these appendices, category “N” means not for EXFOR compilation.)

Table 3. Number of articles for compilation by each centre

	Category A		Category B	
	GSI-ESA-NASA	NUCDAT	GSI-ESA-NASA	NUCDAT
NNDC	8	27	16	49
NEA DB	13	17	-	-
JCPRG	1	3	2	3
CNDC	1	0	3	0
CNPD	1	0	1	7
NDPCI	0	0	1	0
Any	-	-	8	22
Total	24	47	31	81
