ENSDF analysis codes: Web interface and server calculations, maintenance and distribution

Viktor Zerkin

NDS IAEA, Vienna, Austria

Since 2009, EXFOR-ENDF retrieval system was gradually extended by so-called “Uploading” system providing new type of service - SaaS (“Software as a service”). These systems are accessed by authorized users using a thin client via a web browser for processing their own data using software and databases on web server. ENSDF Uploading system was created in 2011 and now includes the following codes: FMTCHK, GTOL, LOGFT, PANDORA, NDSPUB, RADLST. The questions and possible ways of maintenance and distribution of Fortran codes will be observed and presented for discussion.
