この報告書は、日本原子力研究所が JAERI-M レポートとして、不定期に刊行している研究報告書です。入手、複製などのお問合せは、日本原子力研究所技術情報部（茨城県那珂郡東海村）あて、お申しこしください。

JAERI-M reports, issued irregularly, describe the results of research works carried out in JAERI. Inquiries about the availability of reports and their reproduction should be addressed to Division of Technical Information, Japan Atomic Energy Research Institute, Tokai-mura, Naka-gun, Ibaraki-ken, Japan.

Compilation of Measured Capture Cross Sections  
for  
JENDL Fission Product Nuclear Data File

Hiroyuki MATSUNOBU\* and Takashi WATANABE\*\*

Fission Product Nuclear Data Working Group  
Japanese Nuclear Data Committee  
Tokai Research Establishment, JAERI

(Received January 31, 1978)

The status of experimental data of neutron capture cross section is reviewed on 38 fission product (FP) nuclides important for fast reactor calculations. Experimental data are compiled for 24 of the 38 FP nuclides in the energy region above 1 keV.

Appendix I gives outlines of the experiments (neutron energy, number of data points, cross section, neutron source, experimental method, standard cross section,  $\beta$ - and  $\gamma$ -ray data etc.) in tables. Appendix II illustrates the compiled data of neutron capture cross section in figures.

This work was made as a part of evaluation work of Fission Product Nuclear Data Working Group of Japanese Nuclear Data Committee. The authors were supported under the contract with JAERI.

JENDL用・核分裂生成物核データ・ファイル作成のための  
中性子捕獲断面積測定データの収集

日本原子力研究所東海研究所シグマ研究委員会  
松 延 広 幸\*・渡 部 隆\*\*

(1978年1月31日受理)

本報告書は核分裂生成物(FP)核種の中性子捕獲断面積データ収集の結果をまとめたものである。高速炉の燃焼過程で心反応度に大きな影響を与える重要FP(Fission Product)38核種の中で、高速エネルギー領域の中性子捕獲断面積が測定されている24核種に就て、実験データの現状がレビューされている。なお、付録に、実験の主な内容(中性子エネルギー、測定点数、断面積、中性子源、測定方法、標準断面積値、 $\beta$ 線および $\gamma$ 線データ等)が核種毎にテーブル形式で与えられ、また、収集された中性子捕獲断面積データが核種毎にグラフで示されている。

本作業は、シグマ研究委員会・核データ専門部会・FP核データワーキンググループの作業の一環として、核データセンターからの委託調査として行なわれた。

## 1. Introduction

The importance and needs of fission product (FP) nuclear data are rising more and more in the whole fields relating to nuclear power. Responding to these demands, evaluation work of the FP nuclear data for fast reactors has been powerfully performed in JNDC (Japanese Nuclear Data Committee) over several years. Capture cross section is one of the most important FP nuclear data. Accordingly, as a part of this evaluation work, compilation of the experimental data on capture cross section was required in order to examine the systematic trends of mass number and energy dependences of capture cross section, and to increase the reliability of evaluation.

In this compilation work, the experimental capture data in keV and MeV range were surveyed for 100 FP nuclides which selected according to the order of contribution to the capture effect in fast reactor cores. As a result of compilation work, many experimental data were collected for about 50 nuclides. The compiled data were plotted in the figures, and used to normalize the capture cross section obtained by theoretical calculation.

The FP nuclear data evaluated in the present work were compiled in JENDL-1 (Japanese Evaluated Nuclear Data Library, Version 1) which has been completed recently. This document gives a description of compilation of the measured capture cross sections performed in order to prepare the fission product nuclear data file for JENDL-1.

In Section 2, the procedure of data compilation is briefly described. In Section 3, the FP nuclides compiled in this document are shown on the basis of the classification of FP nuclides. In Section 4, the status of the experimental capture data is described for the compiled nuclides. In Section 5, a description on the contents of Tables attached in Appendix I is given. In the last Section 6, some remarks are given for preparation of this document.

Appendix I consists of the above Tables, the abbreviations used in these Tables, and the experimental references. In Appendix II, the Figures of capture cross section are shown for 24 FP nuclides.

## 2. Procedure of literatures and data compilation

Survey on the measurements of capture cross section for FP nuclides was done using CINDA 76/77<sup>1)</sup> and its Supplement 76/77<sup>2)</sup>, and the recent literatures. The contents of measurements were surveyed for the collected literatures over the following items.

neutron energy and its resolution, neutron source, accelerator, method of the measurement, used detector, standard cross section, flux monitor, measured or used  $\beta$ -and  $\gamma$ -ray data and their branching ratio, and measured cross section

The used standard cross section or monitor reaction cross section, and the branching ratio of the decay mode by  $\beta$  and/or  $\gamma$  decay are especially important quantities, because the discrepancies between the cross sections measured by different experimenters might be caused by the differences of these quantities.

The measured capture cross section data were compiled on the basis of the collected literatures and the recent NEUDADA. In a few cases, the data plotted in the figures of BNL-325, Supplement<sup>3)</sup>, or the numerical data described in the comments of CINDA 76/77 were compiled when the numerical data are not given in the original papers and NEUDADA, or the original papers could not be obtained. There are some differences between the original data and NEUDADA on neutron energy and capture cross section in a few nuclides. It is supposed that the original data were revised when they were compiled in NEUDADA. Then, in such a case, the data compiled in NEUDADA were adopted in present compilation.

## 3. FP nuclides compiled in this document

The FP nuclides are classified into some categories according to their contribution to the capture effect in burn up of fast reactor. This classification is given by S. Iijima<sup>4)</sup>. In this document, 38 important FP nuclides classified into "Class I" to "Class III" were picked up, and their experimental capture data in keV and MeV range were searched by the procedure as mentioned in the previous section.

In addition, the capture effect by these 38 nuclides occupies about 93% of that by the whole FP nuclides. As the result of survey, the 38 nuclides were divided as follows.

	Nuclides with the Exptl. Data	No Data Nuclides
Class I	$^{97}\text{Mo}$ , $^{99}\text{Tc}$ , $^{103}\text{Rh}$ , $^{105}\text{Pd}$ , $^{133}\text{Cs}$ , $^{149}\text{Sm}$	$^{101}\text{Ru}$ , $^{107}\text{Pd}$ , $^{135}\text{Cs}$ , $^{147}\text{Pm}$ , $^{151}\text{Sm}$
Class II	$^{95}\text{Mo}$ , $^{98}\text{Mo}$ , $^{100}\text{Mo}$ , $^{102}\text{Ru}$ , $^{104}\text{Ru}$ , $^{109}\text{Ag}$ , $^{141}\text{Pr}$ , $^{150}\text{Nd}$ $^{153}\text{Eu}$	$^{93}\text{Zr}$ , $^{103}\text{Ru}$ , $^{129}\text{I}$ , $^{131}\text{Xe}$ , $^{132}\text{Xe}$ , $^{143}\text{Nd}$ , $^{145}\text{Nd}$
Class III	$^{96}\text{Zr}$ , $^{108}\text{Pd}$ , $^{127}\text{I}$ , $^{139}\text{La}$ , $^{142}\text{Ce}$ , $^{146}\text{Nd}$ , $^{148}\text{Nd}$ , $^{147}\text{Sm}$ $^{152}\text{Sm}$	$^{106}\text{Ru}$ , $^{155}\text{Eu}$

Although a report<sup>5)</sup> on measurement of the capture cross section has been published for  $^{147}\text{Pm}$  in the energy range 20 eV to 10 keV, yet the numerical data have not been published. On the 24 nuclides with the measured capture cross section, Tables showing the contents of the experiments and Figures of their capture cross sections were prepared, and attached in Appendix I and II, respectively.

#### 4. Status of the compiled experimental data

As mentioned in the previous section, the measured capture cross section data were obtained for 24 nuclides from among 38 important nuclides. Although, many data were collected in this compilation, most of the collected data concentrate on  $^{98}\text{Mo}$ ,  $^{100}\text{Mo}$ ,  $^{103}\text{Rh}$ ,  $^{127}\text{I}$ ,  $^{133}\text{Cs}$ ,  $^{139}\text{La}$ ,  $^{141}\text{Pr}$ , and  $^{153}\text{Eu}$ . The data for these nuclides are very abundant and distribute densely over the energy range from eV to MeV. However, it is noticed that there are large discrepancies among the data measured by different experimenters for these nuclides. Particularly, remarkable systematic discrepancies are observed over the wide energy range for the data of  $^{98}\text{Mo}$ ,  $^{100}\text{Mo}$ ,  $^{127}\text{I}$ ,  $^{133}\text{Cs}$ , and  $^{153}\text{Eu}$ .

Next, there are some data in the limited energy range for  $^{95}\text{Mo}$ ,  $^{97}\text{Mo}$ ,  $^{99}\text{Tc}$ ,  $^{105}\text{Pd}$ ,  $^{108}\text{Pd}$ ,  $^{109}\text{Ag}$ ,  $^{148}\text{Nd}$ ,  $^{150}\text{Nd}$ ,  $^{147}\text{Sm}$ , and  $^{149}\text{Sm}$ . It is also pointed out that there are remarkable systematic discrepancies among the data of  $^{109}\text{Ag}$  in the energy range from 10 to 150 keV. The data of  $^{96}\text{Zr}$ ,  $^{102}\text{Ru}$ ,  $^{104}\text{Ru}$ ,  $^{142}\text{Ce}$ ,  $^{146}\text{Nd}$ , and  $^{152}\text{Sm}$  are poor and obtained for only three to nine energy points.

Generally speaking, the data for most of the nuclides exist most abundantly in the energy range around 25 keV. However, it is pointed out that the discrepancies among the data are also most remarkable around 25 keV, as shown in the attached Figures. It is necessary to investigate the cause of these discrepancies and to examine the reliability of the data in order to use these data in evaluation or as a normalization point of calculated cross section.

In this compilation, many new data are collected for 15 nuclides. These new data have been published after 1973 in which FP Nuclear Data Panel<sup>6)</sup> was held at Bologna. The recent measurements for Mo-isotopes have been performed by A. R. de L. Musgrove et al.<sup>7)</sup> in the energy range from 1 to 90 keV in 1976. Their data show good agreement with the data by Kapchigashev et al.<sup>8)</sup> for  $^{95}\text{Mo}$  and  $^{97}\text{Mo}$ , although they deviate from the latter data in some energy intervals for  $^{98}\text{Mo}$  and  $^{100}\text{Mo}$ . The 25 keV data for  $^{98}\text{Mo}$  and  $^{100}\text{Mo}$  have been also presented by R. P. Anand et al.<sup>9)</sup> in 1974. Their data are in agreement with the data by Musgrove et al. and Kapchigashev et al. for  $^{98}\text{Mo}$ , while the data for  $^{100}\text{Mo}$  are considerably lower than those by Musgrove et al. R. P. Anand et al. presented also the 25 keV data for  $^{104}\text{Ru}$ . Their data show good agreement with the 24 keV data by Murty et al.<sup>10)</sup> and Macklin et al.<sup>11)</sup> R. W. Hockenbury et al.<sup>12)</sup> presented a number of data in the energy range from thermal to 300 keV for  $^{103}\text{Rh}$ ,  $^{105}\text{Pd}$ , and  $^{153}\text{Eu}$  in 1975. The abundant data for  $^{103}\text{Rh}$  have been also presented by C. Le Rigoleur et al.<sup>13)</sup> in the same energy range as Hockenbury et al. in 1975. The first measurements for  $^{105}\text{Pd}$  have been performed by R. L. Macklin<sup>14)</sup>, and Hockenbury et al. in 1975. The data by Macklin show the maximum and minimum values around 2.6 keV.

The recent measurements in keV region for  $^{127}\text{I}$  have been performed by N. Yamamuro et al.<sup>15)</sup> at 23.7 keV and K. Rimawi<sup>16)</sup> at 24.3 keV in 1975. Both data show very good agreement. The measurements in MeV region have been done by J. Vuletin et al.<sup>17)</sup> at 14.4 MeV and F. Rigaud et al.<sup>18)</sup> at 14.6 MeV in 1974, and by O. Schwerer et al.<sup>19)</sup> at 14 MeV in 1976. Their data are in agreement with mutually within the experimental errors. Yamamuro et al. presented also the 24 keV data for  $^{133}\text{Cs}$  in 1976. Their data are consistent with the data by Popov and Shapiro<sup>20)</sup> (1962), and show a lower value than the data by Kompe<sup>21)</sup> (1969). Vuletin et al., Rigaud et al., and Schwerer et al. presented also the 14 MeV data for  $^{141}\text{Pr}$ , for  $^{103}\text{Rh}$  and  $^{139}\text{La}$ , and for  $^{139}\text{La}$  and  $^{142}\text{Ce}$ , respectively.

The most recent measurements for  $^{147}\text{Sm}$ ,  $^{149}\text{Sm}$ , and  $^{153}\text{Eu}$  have been performed by B. N. Kononov et al.<sup>22)</sup> in the energy range from 5.5 to 342.5 keV in 1977. Their data for  $^{147}\text{Sm}$  and  $^{149}\text{Sm}$  show considerably higher values than the data by Macklin<sup>23)</sup> at 30 keV. Their data for  $^{153}\text{Eu}$  show also systematically higher values than the data by Konks and Fenin<sup>24)</sup>, Hockenbury et al., and M. C. Moxon et al.<sup>25)</sup>. However, they are in good agreement with the values derived from the data by Czirr<sup>25)</sup> for natural Eu and  $^{151}\text{Eu}$ . The data by Moxon et al. show the lowest values compared with other data in the energy range from 0.1 to 400 keV, but are in agreement with the data by Konks and Fenin, and Hockenbury et al. within the experimental errors.

##### 5. Description on the attached Tables (Appendix I)

The main contents of the measurements on capture cross section are given for 24 FP nuclides in the Tables attached in Appendix I. The items and contents described in the Tables for each nuclide are as follows.

Column 1 : Reference

The literatures cited in the present compilation are given in chronological order by the abbreviations combining the year in which the experiment was done and the name of the leading author. These abbreviations are given in

"Experimental References" of Appendix I.

Column 2 : Energy

The energy range in which the measurement was performed is given in keV unit. The energy resolution is also shown if it was given by the author.

Column 3 : N

This means the number of data points measured.

Column 4 : Measured Cross Section

The measured capture cross section is given in milli-barn unit. The error of cross section is also shown if it was given by the author. However, they are omitted in case of many data points more than 5 points existing.

Column 5 : Neutron Source

The neutron source is shown in the form of radioactive material, or nuclear reaction and/or accelerator used.

Column 6 : Method

The method of measurement is shown with the detectors used.

Column 7 : Standard or Flux Monitor

The standard cross section which was used in relative measurement, or the reaction cross section which was used in determination of the absolute value of neutron flux is given in milli-barn unit with the nuclear reaction form. The reaction form is omitted in some cases, if it is  $(n,\gamma)$  reaction.

Column 8 and 9 : Thermal Cross Section

These columns are only used in case of "double-ratio comparison" technique applied in activation measurement. The thermal cross sections of the standard and target (sample) nuclides are given in barn unit in Column 8 and 9 respectively.

Column 10 : Comments

Appropriate information which is not given in the previous columns is described in this column. Especially, the data

on  $\beta$ -ray and/or  $\gamma$ -ray emitted from the residual nucleus, and their branching ratio are important in order to compare and renormalize the cross sections obtained by various methods and techniques.

In this Table, many abbreviations are used for the simplicity, and in order to give many information. Explanation on these abbreviations is given in the annexed papers of Appendix I.

#### 6. Remarks

This document was prepared as a preliminary one in order to investigate the compiled experimental data and methods, and to promote the evaluation work of the FP nuclear data for JENDL-1. Accordingly, it is expected that this is not complete, but includes considerable defects. The revision of this document will be done in the next step of evaluation work. At the next step, the format of Tables and the abbreviations used in Tables will be modified to be more complete, effective and simple.

The purpose of this document is to clarify the status and problems of the experimental data, and to provide the subject matter of data evaluation.

#### Acknowledgement

The authors wish to cordially thank Dr. S. Iijima for his advice, discussion, and encouragement for this work. They are grateful to Dr. A. Asami and Prof. N. Yamamuro for their discussion and comments on the details of experiments. They are also indebted to Mr. T. Yoshida for introduction of a new literature on nuclear data evaluation, and to Mr. T. Nakayawa for his effort on retrieval of the data file.

## Abbreviations used in Table (Appendix I)

Column 1

## Reference

References of abbreviations used in this column are given in Experimental References.

Column 4

## Measured Cross Section

- m* : Cross section to the meta-stable state
- g* : Cross section to the ground state

Column 5

## Neutron Source

- BARC : Bhabha Atomic Research Centre, Trombay
- CASCD-GEN : Cascade generator
- C-W : Cockcroft-Walton type accelerator
- ELA, or  
ELST-ACLTR : electrostatic accelerator
- ELST-GEN : electrostatic generator
- Fe-FILT-N : Fe-filtered neutron
- HAR : Harwell, AERE
- KUR : Kyoto University Research Reactor Institute
- LINAC : electron linear accelerator
- LRL : Lawrence Radiation Laboratory
- nat. U : natural uranium
- n-booster : neutron booster
- NUCL EXPL : underground nuclear explosion
- ORELA : Oak Ridge Electron Linear Accelerator
- ORNL : Oak Ridge National Laboratory
- PHOTO-N : Photo-neutron
- RPI : Rensselaer Polytechnic Institute
- SDT-N : slowing-down-time neutron
- THR-N : thermal neutron
- VDG : Van de Graaf accelerator

Column 6

## Method

- (ABS) : absolute measurement
- ACT : activation method (technique)
- Anth. SC : anthracene scintillation counter
- $^{10}\text{BF}_3$ -LC :  $^{10}\text{BF}_3$  long counter
- $^{10}\text{B-NaI}$  :  $^{10}\text{B-NaI}$  detector
- $\text{C}_6\text{F}_6$ -SCINT :  $\text{C}_6\text{F}_6$  scintillator
- DRC : double-ratio comparison
- EW-G-M : end-window G-M counter
- EW-PC : end-window proportional counter
- EW- $\beta$  : end-window  $\beta$  counter
- GAS-DIS-PC : gas-discharge proportional counter
- Ge(Li) : Ge(Li) spectrometer
- G-M, GM : Geiger-Müller counter
- LIQ-SCINT : liquid scintillator
- LIQ-SCINT-T : liquid scintillation tank
- or SC-T : or SC-T
- LONG-C : long counter
- M-R : moxon-Rae counter
- NaI : NaI crystal (scintillator)
- NaI(Tl) : NaI(Tl) crystal, (scintillation  $\gamma$ -spectrometer)
- Pb-SDTS : Pb slowing-down-time spectrometer
- PROP-C, or PROP : proportional counter
- SCINT, or SC : scintillation counter

TOF	:	time of flight method (technique)
TSG, or RG-TRANS:	:	transmission sphere geometry(ring geometry)
$^{235}\text{U}$ -FC	:	$^{235}\text{U}$ fission counter (chamber)
$\alpha$ -DTCTR	:	$\alpha$ particle detector
$\beta$ -counter	:	$\beta$ -ray counter
$\beta$ -PROP.C	:	$\beta$ -ray proportional counter
$\gamma$ -PC	:	$\gamma$ -ray proportional counter
$\phi_n$	:	Neutron flux (beam)

Column 7 Standard or Flux Monitor

Allen & Henkel ('58)	:	Allen, W. D. and Henkel, R. L. : Prog. Nucl. Ener., Ser. I, Vol II (1958)

BNL-325 '65	:	Neutron Cross Section, BNL-325, 2nd Edition Suppl. No. 2, Vol. III (1965)
BNL-325 '66	:	Neutron Cross Section, BNL-325, 2nd Edition Suppl. No. 2, Vol. II B (1966)

Column 10 Comments

BNL-325, 2nd, Suppl. ('66)	:	BNL-325, 2nd Edition, Suppl. No. 2, Vol II C (1966)
72 Budapest, p. 220 ('72)	:	Irigary, J. L., Rigaud, F., Petit, G. Y., Longo, G., and Saporetti, F. : Conference on Nuclear Structure and Study with Neutrons. Budapest, p. 220 (1972)
Data : Fig. 3	:	The measured cross sections are plotted in Fig. 3 of the original paper.
Data:NEUDADA	:	This means that the data were adopted from NEUDADA, because the literature didn't be obtained in present work, or the numerical data are not given in the original paper.
En	:	neutron energy
En & $\sigma_{ny}$ :data	:	This means that En and $\sigma_{ny}$ were adopted from NEUDADA, because the original values of En and $\sigma_{ny}$ were revised when the data were compiled in NEUDADA.
compiled in NEUDADA	:	

$^{151}\text{Eu}$ data of Konks & Fenin('64)	: Konks, V. A. and Fenin, Yu. I. : Conference on Interaction of Neutrons with Nuclei. Dubna, Report No. 1845 (1964) [64a Konks]
$4\pi$ -geom. $\gamma$	: $4\pi$ -geometry gamma-counting technique
Hughes et al.('60)	: Hughes, D. J., Magurno, B. A., and Brussel, M. K. : Neutron Cross Sections, BNL-325, 2nd Edition (1960)
integrated $\sigma_{ny}$	: $(n, \gamma)$ cross section integrated over the energy of emitted $\gamma$ -ray
mon. reac. : $\alpha$	: This means that $\alpha$ particles were measured as a monitor reaction.
NDS	: Nuclear Data Sheet, compiled by K. Way et al. : National Academy of Sciences, National Research Council, Washington 25, D. C.
Norm.	: normalization
ORELA	: Oak Ridge Electron Linear Accelerator
PR 142, 725('66)	: Grissom, J. T., Koehler, D. R., and Alford, W. L. : Phys. Rev., 142, 725 (1966)
Relative .	: relative measurement
Rev. Mod. Phys.: 30, 585 ('58)	: Strominger, D., Hollander, J. M., and Seaborg, G. T. : Rev. Mod. Phys. 30, 585 (1958) ; Nuclear Data Cards (National Research Council, Washington 25, D. C. )
RP	: resonance parameter
T 1/2	: half life
6th TI	: Lederer, C. M., Hollander, J. M., and Perlman, I. : Table of Isotopes, Sixth Edition, (1967)
TICC,or Table of ICC	: Sliv, L. A. and Band, I. M. : Table of I. C. C., Alpha-Beta-and Gamma-Ray Spectroscopy, Vol. 2, p. 1638 (1963)
upper limit	: This means that the measured cross section is the upper limit only due to insufficient yield.
$\beta$	: $\beta$ -ray counting
$\gamma$	: $\gamma$ -ray counting
$c_g$	: capture cross section to the ground state
$c_m$	: capture cross section to the meta-stable state
