I. INTRODUCTION

This issue of WRENDA contains 1190 requests for nuclear data measurements for 632 data types needed in support of the fission reactor development programmes of 21 Member States of the IAEA and one International Organization. This is the first edition to be printed from the computerized data request file maintained by the Agency's Nuclear Data Section (NDS). The input to this data request file is provided by officially constituted bodies in the Member States through the four regional neutron data centres (NNCSC, NDCC, NDS, and CJD)¹⁾. The requests from Australia, Belgium, Bulgaria, Council of the European Communities, Finland, France, Federal Republic of Germany, Italy, Netherlands, Sweden, Switzerland, the United Kingdom, and the United States have been reviewed and updated since the last WRENDA publication.

The use of a "request list" to provide information to measurers of neutron data on the needs of developing technologies for such data is long standing in both the United States and the United Kingdom. In 1968, the Neutron Data Compilation Centre at Saclay initiated publication of a request list from a computerized file, known as RENDA, on behalf of the European-American Nuclear Data Committee (EANDC). The list contained requests from those countries represented on that committee. In 1971, the International Nuclear Data Committee (INDC) recommended that the IAEA assume responsibility for publication of an expanded international request list.

The first international request list was published in 1972 using the Saclay RENDA file with additional requests included, from countries outside the EANDC area. During the transfer of responsibility from NEA to the IAEA, a further edition, WRENDA 73, was published from the RENDA file with assistance of NDCC Saclay in order to take account of a completely revised United States Request List.

¹⁾ NNCSC - National Neutron Cross Section Center, Brookhaven National Laboratory, Upton, L.I., N.Y., USA
NDCC - Neutron Data Compilation Centre, Nuclear Energy Agency, Saclay, France
NDS - Nuclear Data Section of the International Atomic Energy Agency, Vienna, Austria
CJD - Centr po Jadernym Dannym, Obninsk, USSR

For the present edition a new publication format has been adopted whereby all requests for a given material and data type have been blocked together. Status comments no longer apply to a particular request but to the status of a data type for a given material. These comments are printed, where available, following the data measurement request block. Whenever possible coded information appearing in the data file have been expanded to improve the readability of the publication.

The request list is meant to serve as a guide to measurers and scientific and technical administrators in the Agency's Member States when planning nuclear data measurement programmes. Measurers, when initiating an experiment that will provide data requested in this document, are asked to inform the requestor(s) of the planned measurements. Information on such experiments should also be provided to NDS so that status comments can be kept current. The names of the requestors are printed with each request and their addresses are given in Appendix D.

The WRENDA file also contains requests for nuclear data measurements needed in support of fusion reactor and safeguards techniques development. These requests, upon recommendation of the International Nuclear Data Committee (INDC), are published in separate INDC documents. Special retrievals from the file can be obtained from the IAEA Nuclear Data Section upon request.

Future editions of WRENDA will be issued annually in the spring. Before each publication, the local data committees will be asked to review their data requests so that any changes can be made and the list can be kept current. Comments from the users of WRENDA are encouraged, so that the document can meet their needs.

II. DESCRIPTION OF REQUESTS

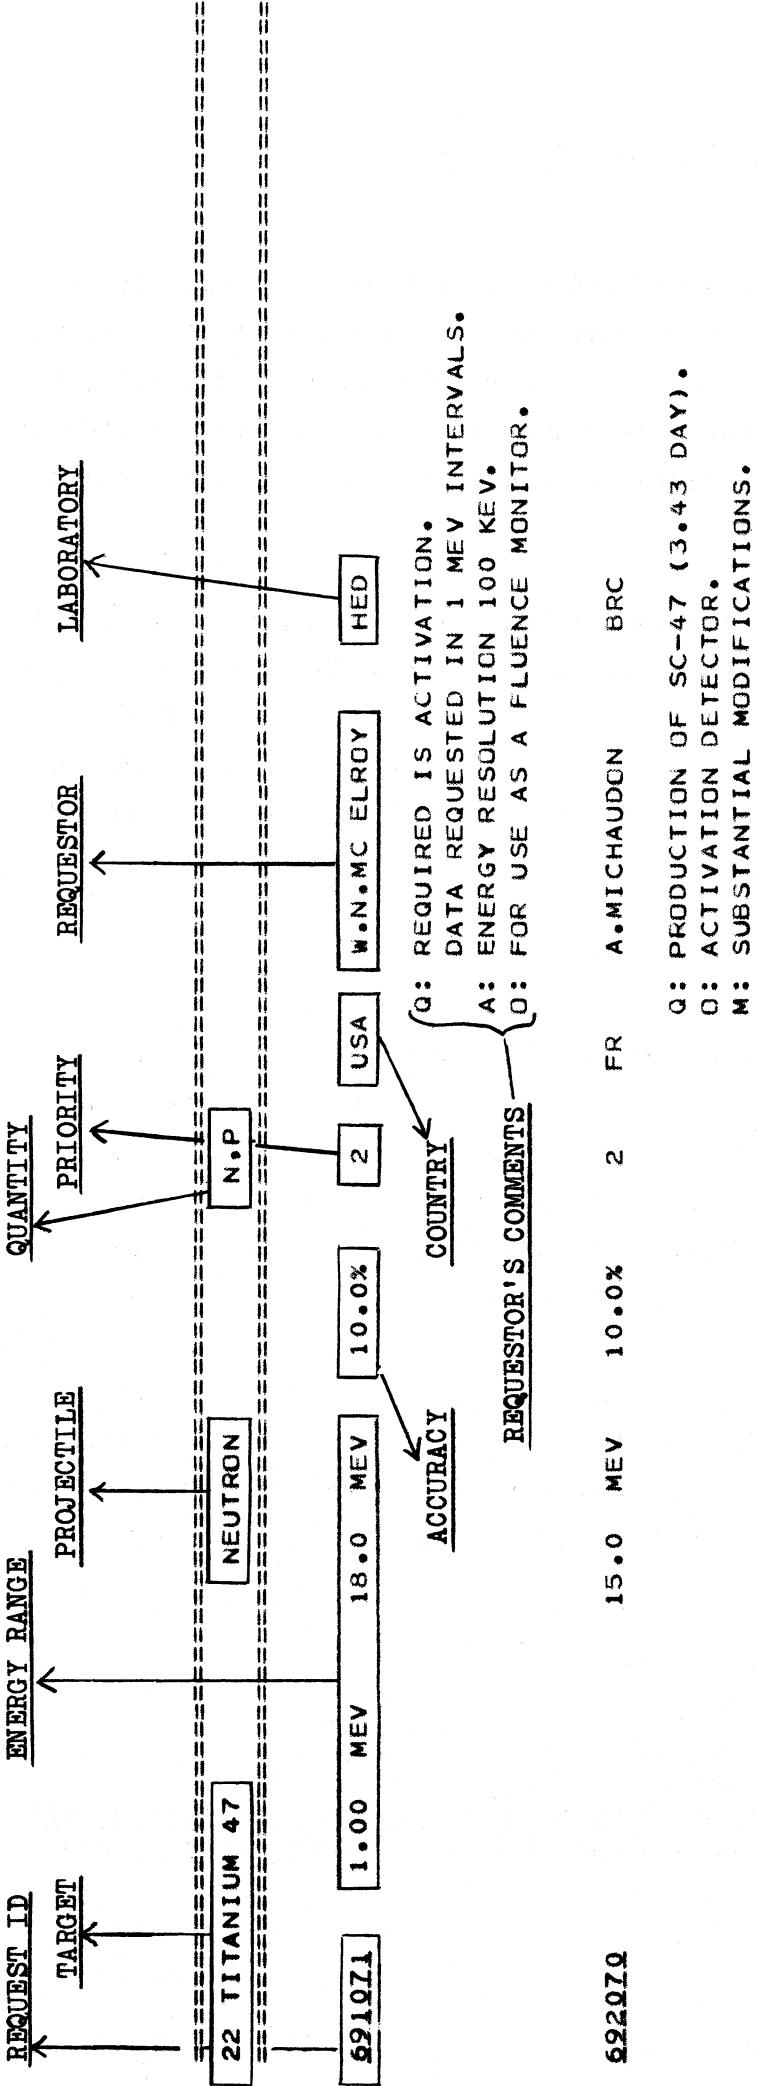

This request list is presented in a sort by increasing target charge (Z) and mass (A) number, then by projectile type starting with the lightest (γ -rays) and sorted by increasing mass, and finally by reaction type. All requests for a single target nuclide, projectile and reaction are blocked together. A sample is shown on the following page.

Each request block consists of two parts separated by a single line. The first part contains all the requests for one target-projectile-quantity combination. The second part called "STATUS" contains comments on the present state of knowledge of this data type. Where there are no status comments in the WRENDA file, this second part is omitted.

Block-heading

The first line of each request block gives, from left to right, the target nuclide, the incident particle, and the quantity. This line of text is enclosed by a double line to make the beginning of each block stand out visually. The meaning of a quantity generally conforms to CINDA²⁾ usage with the addition of some quantities to describe nuclear structure data and complex reactions. A list of the allowed quantities appears as part of the next section. The target nuclide description consists of the charge number, the element name, and the mass number of the isotope. No mass number is given when the natural element is meant, except in the case where the natural element is monoisotopic. Mixtures and compounds appear at the end of the list.

2) CINDA - An Index to the Literature on Microscopic Neutron Data
published annually by the International Atomic Energy Agency

STATUS-----

ANL MEADOWS+ - USNDC-3 16(1972), DATA TO 6. MEV.

AUB GHORAI+ - JNE 25 319(1971), DATA TO 6.1 MEV.

STATUS COMMENTS

Identification number

The individual requests then follow in order of increasing identification number. This number appears on the first line of each request at the far left and is underlined. The number assigned is unique and remains associated with a request. When a request is withdrawn, this number is not assigned to another request. The first two digits of the identification number are the last two digits of the year in which the request was originated. The third digit represents the responsible neutron data center (1-NNCSC, 2-NDCC, 3-NDS, 4-CJD) and the final three digits are a sequence number. The neutron data centers are responsible for assigning the identification number.

Energy

The next two entries on the first line of each request give the range of energy of the incident particle for which the measurement is desired. The energy unit is given after each number. Because no lower case is used, we have adopted the symbol, MV, for milli-electron volts, thus preventing confusion with MEV for million electron volts.

If an energy appears in the first field with the second field blank, then the measurement is required at only a single energy. In the case of a resonance integral, the single entry gives the lower energy limit for the integral. A lone entry in the second energy field with the first field blank indicates that measurement is desired for energies up to the specified value. This format appears most frequently for threshold reactions. No alphabetic energies are allowed. Thus thermal is given as 25.3 MV. All spectrum averages and non-standard energy specifications must be explained in the requestor's comments.

Accuracy

The fourth field on the first line gives the accuracy required of the measurement stated in percent. Any accuracy requirements which cannot be stated simply must be given in the requestor's comments. All accuracies are assumed to be one standard deviation. Any other meaning must be explained in the comments.

Priority

The fifth field on the second line gives the priority of the measurement. Requests are assigned priority 1,2 or 3. These priorities are defined as follows.

* Priority 1 *

Nuclear data which satisfy the criteria of Priority 2 and which have been selected for maximum practicable attention, taking into account the urgency of nuclear energy programme requirements.

For example, the European American Committee for Reactor Physics assigns its highest priorities for reactor measurements as follows:

" The highest priority should be given to requests for nuclear data for reactors to be built in the near future if:

a. These data are still necessary to predict the different reactor properties after all information from integral experiments and operating reactors has been used; or

b. information on an important reactor parameter is in principle attainable through mathematical calculation from nuclear data only; or

c. these data are needed for materials required in reactor physics measurements. "

* Priority 2 *

Nuclear data which will be required during the next few years in the applied nuclear energy programme (e.g. the design of a reactor or fuel processing plant; data needed for optimum use of reactor fuel and construction materials such as neutron moderators, absorbers and radiation shields; space application and biomedical studies; data required for better understanding of some significant aspect of reactor behaviour).

* Priority 3 *

Nuclear data of more general interest and data required to fill out the body of information needed for nuclear technology.

Requestor

The right hand side of the second line is used to identify the requestor. The first piece of information is a three letter code for the country originating the request. The codes and their explanations are given in Appendix A. The country code is followed by the name of the requestor. Mailing addresses for the requestors are given in Appendix D. The last piece of information is a three character code for the requestor's organization. These codes conform to the CINDA codes and are listed along with the organization name in Appendix B. In the case where there is more than one requestor for a request, then their names and organization codes are given on successive lines. However all requestors so combined must come from the same country.

Requestor's comments

Comments by requestors follow below the requestors' names on the right hand side of the page. The comments are grouped into four types

denoted by the characters Q, A, O and S. The group of comments designated by Q refers to further experimental specifications such as details of the quantity to be measured and the energy range of incident or secondary particles. Those denoted by an A refer to further details concerning accuracy or energy resolution required. The category O includes all other comments such as use of or justification for requested data. The last group of comments designated by an M contains statements about modifications which have been made since the previous version of WRENDA, such as "new request" etc.

Status comments

The status comments for a block of requests generally consist of an organization code (see Appendix B for explanations) followed by a name and a comment. In the present edition of WRENDA and for the foreseeable future these comments will be references to related, recently completed experiments or to experiments underway. In some cases, general status comments as to various discrepancies or attained accuracies will appear. It is hoped that more comments of this type will appear in the future.

All references to a publication will use CINDA type codes. These codes and their expanded form are given in Appendix C. The name given at the beginning of a comment is either the author or first author of a publication or the source of the general comment.

III. HOW TO FIND A REQUEST IN WRENDA

As is discussed in the previous section, all data requests for a single target nucleus, projectile, and reaction quantity are blocked together. These blocks are sorted by target - projectile - reaction in that order.

The target nuclei are in increasing order of Z and within Z, A. Elements which are isotope mixtures appear before individual isotopes. Monoisotopic elements appear at their natural position in order of increasing A. Requests for lumped fission products appear at the end followed by compound targets.

In this section are three further tables for assistance. The first table is an index to the request list. This index gives number of the page on which the first block for any target nucleus (Z,A) appears. The second table gives the projectile particle sort order and the third table gives the reaction quantity sort order.

O: FOR FAST REACTORS.
DISCREPANCIES IN RESONANCE PARAMETERS EXIST.

714002 25.3 MV 4.00 KEV 1 CCP M.N.NIKOLAEV FEI

Q: CAPTURE WIDTH OF 2.9 KEV RESONANCE SHOULD BE
MEASURED IN THREE DIFFERENT EXPERIMENTS. RESULTS
SHOULD COINCIDE WITHIN LIMITS OF 5-7 PERCENT.
IF HIGH RPI CAPTURE WIDTH CONFIRMED, ENERGY
DEPENDENCE OF CAPTURE CROSS SECTION SHOULD BE
MEASURED FROM THERMAL TO RESONANCE REGION TO
INVESTIGATE INTERFERENCE BETWEEN DIRECT AND
RESONANCE CAPTURE.
MEASUREMENTS OF GAMMA RAY SPECTRA IN THERMAL AND
2.95 KEV REGIONS DESIRABLE FOR DECISION ABOUT
EXISTENCE OF INTERFERENCE EFFECTS.
A: ACCURACY REQUIRED TO BETTER THAN 10. PERCENT.
O: FOR FAST REACTOR K-EFF AND BREEDING RATIO
CALCULATION AND EVALUATION OF SODIUM ACTIVATION.

VI. LIST OF WITHDRAWN REQUESTS

Due to the extensive revisions made to WRENDA 73, more than 400 requests have been withdrawn. Because the list is so extensive and because the request numbering system has been changed (making cross referencing very awkward) the list of withdrawn requests will not be published in this edition. However the previous practice will be resumed in the next edition where the identification numbers and the target, projectile and quantity will be given for each withdrawn request.

NUCLEAR ENERGY DIVISION
MAIL CODE 581
175 CURTNER AVENUE
SAN JOSE, CALIF. 95125
U.S.A.

STREETMAN, J.R.

LOS ALAMOS SCIENTIFIC LABORATORY
P.O. BOX 1663
LOS ALAMOS, NEW MEXICO 87544
U.S.A.

SYMONDS, J.L.

AAEC RESEARCH ESTABLISHMENT
THE DIRECTOR'S OFFICE
PRIVATE MAIL BAG
SUTHERLAND, N.S.W.
AUSTRALIA

TELLIER, H.

CENTRE D'ETUDES NUCLEAIRES DE SACLAY
B.P. NO 2
F-91190 GIF SUR YVETTE
FRANCE

TYROR, J.G.

HEAD, GENERAL REACTOR PHYSICS
DIVISION
ATOMIC ENERGY ESTABLISHMENT
WINFRITH, DORCHESTER, DORSET
UNITED KINGDOM

VAN DER WALT, R.

ATOMIC ENERGY BOARD
PRIVATE BAG X256
PRETORIA
SOUTH AFRICA

WALKER, W.H.

REACTOR PHYSICS BRANCH
CHALK RIVER NUCLEAR LABORATORIES
ATOMIC ENERGY OF CANADA LIMITED
CHALK RIVER, ONTARIO
CANADA

WELLER, F.

INSTITUT FUER NEUTRONENPHYSIK
UND REAKTORTECHNIK
KERNFORSCHUNGZENTRUM KARLSRUHE
POSTFACH 3640
D-75 KARLSRUHE
FEDERAL REPUBLIC OF GERMANY

WHITTAKER, A.

WINDSCALE REACTOR DEVELOPMENT LABS
WINDSCALE WORKS
SELLAFIELD, CALDERBRIDGE, CUMBERLAND
UNITED KINGDOM

WRIGHT, S.B.

ATOMIC ENERGY ESTABLISHMENT
HARWELL, DIDCOT
BERKS OX11 ORA
UNITED KINGDOM

ZETTERSTROEM, H.O.

RESEARCH INSTITUTE OF NATIONAL DEFENCE
DEPARTMENT 4
S-104 50 STOCKHOLM 80
SWEDEN

LIST OF ELEMENTS

H	1	HYDROGEN	KR	36	KRYPTON	LU	71	LUTETIUM
HE	2	HELIUM	RB	37	RUBIDIUM	HF	72	HAFNIUM
LI	3	LITHIUM	SR	38	STRONTIUM	TA	73	TANTALUM
BE	4	BERYLLIUM	Y	39	YTTRIUM	W	74	TUNGSTEN
B	5	BORON	ZR	40	ZIRCONIUM	RE	75	RHENIUM
C	6	CARBON	NB	41	NIOBIVM	OS	76	OSMIUM
N	7	NITROGEN	MO	42	MOLYBDENUM	IR	77	IRIDIUM
O	8	OXYGEN	TC	43	TECHNETIUM	PT	78	PLATINUM
F	9	FLUORINE	RU	44	RUTHENIUM	AU	79	GOLD
NE	10	NEON	RH	45	RHODIUM	HG	80	MERCURY
NA	11	SODIUM	PD	46	PALLADIUM	TL	81	THALLIUM
MG	12	MAGNESIUM	AG	47	SILVER	PB	82	LEAD
AL	13	ALUMINUM	CD	48	CADMUM	BI	83	BISMUTH
SI	14	SILICON	IN	49	INDIUM	PO	84	POLONIUM
P	15	PHOSPHORUS	SN	50	TIN	AT	85	ASTATINE
S	16	SULFUR	SB	51	ANTIMONY	RN	86	RADON
CL	17	CHLORINE	TE	52	TELLURIUM	FR	87	FRANCIUM
AR	18	ARGON	I	53	IODINE	RA	88	RADIUM
K	19	POTASSIUM	XE	54	XENON	AC	89	ACTINIUM
CA	20	CALCIUM	CS	55	CESIUM	TH	90	THORIUM
SC	21	SCANDIUM	BA	56	BARIUM	PA	91	PROTACTINIUM
TI	22	TITANIUM	LA	57	LANTHANUM	U	92	URANIUM
