## **Abstract**

The report describes the procedures for the verification of nuclear data files adopted at the IAEA-NDS. Part A addresses the basic evaluated nuclear data files. Part B refers to application libraries in ACE format for Monte Carlo calculations.

August 2005

## TABLE OF CONTENTS

Sample comparison plots .....	24

### APPENDIX B

Sample list file from the ACE library verification sequence .....	27
Comparison plots to check ACE library processing .....	36

## 1. Evaluated nuclear data files

### 1.1 Objectives

#### 1.1.1 General objectives

The main objective is to verify that the evaluated nuclear data files conform to ENDF format rules, that they are readable, complete, self-consistent and that they truly reflect the basic data from which they were generated.

#### 1.1.2 Specific objectives

The main objective is achieved through the following:

- Verification of the formal correctness, and internal consistency of the file.
- Verification the cross sections by comparison to other libraries and experimental data in the EXFOR database.

### 1.2 Procedures

#### 1.2.1 Verification of formal correctness and internal consistency

Verification of the formal correctness, and internal consistency of the file is achieved by running the ENDF Utility Codes available from the IAEA web server "<http://www-nds.iaea.org>". The following codes must be executed:

1. CHECKR to check for format errors.
2. FIZCON to check internal consistency of the data.
3. PSYCHE to perform additional checks of internal consistency of the data.

The user should be aware that the above verification procedure cannot trap all errors, but successful completion of the tests ensures with a high probability that the files are processable.

#### 1.2.2 Verification by comparison with experimental data

Comparison of the data in an evaluated nuclear data file with other libraries and experimental data in the EXFOR database can be performed with the ENDVER package available from the IAEA on CD-ROM and can ordered on-line from the web server "<http://www-nds.iaea.org>". The procedures in ENDVER make extensive use of the ENDF Pre-Processing Codes, which are also available from the same address. The verification procedure for a single-material evaluation consists of the following steps:

1. Retrieve the experimental data and convert them to computational format.
2. Select evaluated data files for comparison and process them into pointwise representation.
3. Extract information from the ENDF files that can be compared to the experimental data and prepare graphic files.
4. View the graphic files and check for consistency.
5. Optionally, run COMLOT of the ENDF Pre-Processing codes to compare pointwise ENDF file with some other file to which the tested file might closely relate. Note that such comparison only includes the cross section data.

The EXFOR database is an integral part of the ENDVER package. Tasks 1-4 can be done through a user-friendly graphics interface. See ENDVER documentation for additional details.

### 1.3 Output

For archival purposes the following information is required:

1. Comments on the scope of testing and justification for any deviation from the standard.
2. List file from CHECKR, FIZCON and PSYCHE.
3. List files from LINEAR, RECENT, LEGEND and SIXPAK.
4. List file from EXFOR retrieval.
5. Comparison plots for all reactions in the list file from the EXFOR retrieval.
6. Plots comparing two libraries with COMPLIT (if applicable).
7. Comments on any messages or discrepancies identified by the checking procedure.

For the interpretation of the messages from the checking codes and the Pre-Processing codes the original documentation should be consulted. In Appendix A, samples of list files corresponding to items 2, 4 and 5 are presented. Sample listings from item 3 are also part of the ACE library validation and can be seen in Appendix B.

Comparison plots under item 5 show ENDF/B-VI Release 8 (labelled “e68”) and JEFF-3.1 (labelled “f31”) nuclear data libraries.

## 2. Ace library for monte-carlo codes

### 2.1 Objectives

#### 2.1.1 General objectives

The main objective is to verify that the files are complete, readable and that they truly reflect the basic data from which they were generated.

#### 2.1.2 Specific objectives

The main objective is achieved by producing and archiving the following additional information:

- Listing of the summary of contents of the ACE file.
- Verification of the cross sections in the file by comparison with independently calculated set to check:
  - Cross section reconstruction from resonance parameters.
  - Interpolation linearisation tolerance.
- Verification of the cross sections by comparison to other libraries and experimental data in the EXFOR database (if not available for the source evaluated data file).

## 2.2 Procedures

### 2.2.1 Summary of contents of an ACE file

A summary of contents provides information on which reactions are present in the file and whether they include gamma-production data, gas production, radiation damage and dpa cross sections, etc. To produce the summary listing the ACELST code can be used, which is part of the SIGACE package of *Ace Library Support Utilities*, available from the IAEA web server "<http://www-nds.iaea.org>".

### 2.2.2 Cross section processing verification

The ACE libraries are generally produced by the NJOY nuclear data processing system. Although "ACE" stands for "A Compact ENDF", there is nevertheless some data processing involved, which is susceptible to code errors. Verification of the cross section data by comparison to an independently processed data set may highlight possible errors due to:

- ACE file assembly.
- Data linearisation.
- Resonance reconstruction.
- Conversion of data representation for angular and energy distributions (where applicable).

For all intents and purposes we may consider the ENDF Pre-Processing codes to be independent of NJOY and suitable for the data verification tasks.

The above-listed checking tasks can be accomplished by executing the following sequence of codes:

1. Run the ACER module of NJOY in edit mode on the tested ACE file.
2. Run ACELST to generate the ACE file summary of contents and to convert the data as much as possible into pointwise ENDF format.
3. Retrieve the basic evaluated nuclear data file from which the ACE library was generated.
4. Run LINEAR on the tested file to linearise any non-linear interpolation laws.
5. Run RECENT on the output of LINEAR to reconstruct cross sections from the resonance parameters.
6. Run SIGMA1 on the output of RECENT to Doppler-broaden the cross sections to the same temperature that is specified in the ACE file.
7. Run FIXUP on the output of SIGMA1 to reconstruct the redundant cross sections.
8. Run COMPLOT to compare the output of ACELST and SIGMA1.
9. Optionally, run COMPLOT on FIXUP outputs generated from the tested ENDF file and some other file to which the tested file might closely relate.

Each of the tasks above serves a specific purpose and provides useful information:

- Re-running ACER makes use of the checking functions built into the ACER module

to check file integrity, correct small errors and provide diagnostic messages about possible problems in the file.

- The ACELST code provides a compact listing of the contents of the ACE file, which is useful when insufficient information is provided on how the file was generated.
- The COMPLIT comparison of the ACELST and SIGMA1 output can reveal any inconsistency in the redundant reactions. For example, the total cross section in the ACELST output from the ACE file is given by the sum of the partials, but in SIGMA1 it is calculated directly from the total cross section. An inconsistency in the resonance range might indicate that the implied competitive widths in the resonance parameters are inconsistent with the pointwise data in file MF3 for the competing reaction (usually the inelastic cross section).
- Special care is required in the interpretation of the comparison of ACELST and SIGMA1 output due to inherent differences between NJOY and the Pre-Pro codes. One of the crucial differences is the list of reactions and the upper energy cutoff to which Doppler-broadening is applied. Normally, NJOY performs Doppler broadening only for the total, elastic, capture and fission reactions up to the upper energy limit of the resonance range. This is generally a good and practical approach, since any structure above the resonance range results from high-resolution measurements at room temperature and does not require Doppler broadening from zero-Kelvin temperature. Note that threshold reactions are usually excluded from Doppler broadening in NJOY. On the contrary, Pre-Pro codes Doppler-broaden all cross sections over the entire energy range. The user must be very careful how he performs Doppler broadening to higher temperatures when strong resonance structure is given in the file above the resolved resonance range.

### 2.3 Output

For archival purposes the following information is required:

1. List file from the ACELST code to provide summary information on the contents of the analysed ACE file.
2. List file from COMPLIT comparing the contents of the ACE file with an equivalent file generated from the same source evaluated nuclear data file with the PrePro codes.
3. Plots generated by COMPLIT (if any) for the above comparison.
4. Comments on the observed discrepancies.

Batch procedures and programs for automated execution of the test sequence on Windows were developed and are available from the IAEA-NDS web site <http://www-nds.iaea.org/ads/>. An example of the integrated output file for archival is shown in Appendix B.

Test case refers to the verification of the ADS-Lib/V1.0 library based on uncorrected JEFF-3.1 data. For the full library and the updates see <http://www-nds.iaea.org/ads/>.

## APPENDIX A

### Sample list file from CHECKR

```
PROGRAM CHECKR VERSION 7.02                               Run on 25-Aug-2005

26-Fe-57 293.6 K fast data for ADS library  
Source file : fe057.ace  
Material ZAID identifier : 26057.31c  
Processed on : 07/31/05  
MAT identifier : mat2634  
Atomic weight ratio : 56.44630  
Temperature [K] : 293.6  
Upper energy limit [MeV] : 200.0  
Data table length : 398361  
Number of energy points : 8981  
Photon production data : Discrete reactions given  
WARNING - also specified : Matrix of secondary photon energies

Summary table legend:

MT -ENDF reaction MT number  
Q -Reaction Q value  
n -number of outgoing neutrons and coordinate system for angular distrib.  
(CM=centre-of-mass, LA=lab)  
Angle -Type of distribution (Isotr. or Law 44)  
or "Aen mm" for tabulated distributions at mm energy points  
E-law -Secondary neutron energy distribution law index list  
Ty -Photon production cross section source (12=MF12, 13=MF13, 16=MF 6)

Cross sections (excluding elastic)					Photon Production

Comparison of Evaluated Data (COMPLIT 2002-1)

Description of Plotter and Frame Layout

Plotter X Dimensions----- 0.0000 to 13.0000
Plotter Y Dimensions----- 0.0000 to 10.5000
Plots per Frame (X by Y)----- 1 by 1
Character Size Multiplier----- 2.00
Plot Orientation----- X Horizontal/Y Vertical

Data Filenames

Datal=PP02ENDF.DAT
Data2=ACE2ENDF.DAT

Retrieval Criteria----- ZA
Grid Type----- Tick Marks
Border on Plots----- Yes
Line Thickness----- 0
Plot Mode----- Cross Section Plus Cross Section Over Ratio
Starting Plot Number----- 1
On Screen Background Color---- White

Maximum Ratio on Plots----- 1.0500 ( 5.0000 per-cent)

Data Identifications

Datal=ENDF
Data2=ACE

Request Ranges

### Comparison plots to check ACE library processing

Only two plots are presented. The first plot reveals that there is a problem of consistency of the redundant cross sections (i.e. the total), caused by the inconsistency between the implicit competitive width in the resonance parameters and the corresponding pointwise data in file MF 3. The second plot shows differences at real discontinuities of cross sections in the file due to a change of data representation, which are artificially removed in ACE files, in addition to some small fluctuations most likely caused by the differences in the Doppler broadening of cross sections.

Conclusion from the first plot is that the source evaluated data file needs to be corrected, whereas the differences indicated in the second plot might be tolerated.

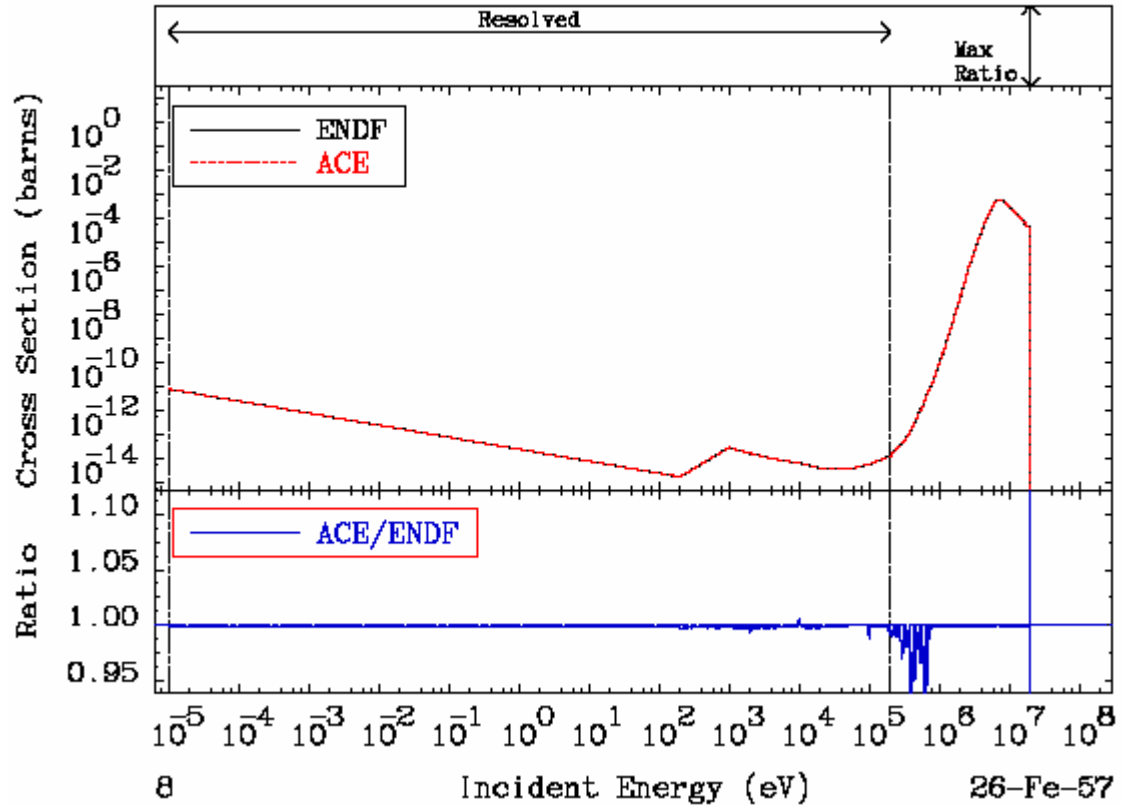

MAT 2634

834.9 keV (n,α') Level
