## INTRODUCTION

The reports which follow were presented to the AEC Nuclear Cross Sections Advisory Group at the Meeting on November 10-11, 1966 held at Argonne, Illinois. These reports contain informal statements of recent developments, changes of emphasis, and preliminary data which are of importance to the cross section measurement program of the U.S. Atomic Energy Commission. They are not intended to be complete, nor do they cover all of the work in the reporting laboratories relating to nuclear cross section measurements.

The data which appear in this report must not be quoted in publications without the expressed permission of the experimenter whose name is associated with the work. Because of occasional violations of this request, a special warning to this effect appears on each page of this issue. In addition, persons who might make use of these data for serious computations should contact the experimenter directly to verify the data.

As for the previous report, WASH-1068, this compilation has been made almost completely from master copies prepared by the laboratory representatives listed in the Table of Contents. It is a pleasure to acknowledge their assistance in this effort.
